TEC 1D Vintage Computer EPROM Emulator Board | eBay

This board was designed to replace the 27C32 EPROM and allow rapid uploading of the binary through a USB interface, and power the TEC through the same USB micro cable.

The default ROM loaded at power up is the MON1b/2 ROM set. Using the command line tool or the supplied python script, you can replace up to 4kbytes of ROM in under a second with z80 to execute the new code.

Tested stable operation up to 12mhz.

Fully assembled and programmed. The pin headers are not soldered for the EPROM connection so they don't get damaged or bent during shipping. If you need them soldered, leave a note.

USB micro cable not included.

Requires the installation of unsigned drivers in windows.

Free Untracked shipping. If you need it tracked, contact prior to purchasing.
